Source Title: HIV Annual Retention in Care
Source Reference Id: CMS1157
Source Specification Link (if applicable): HIV Annual Retention in Care

Overview/rationale: The HIV "continuum of care" is the process of HIV testing, linkage to HIV care, initiation of antiretroviral therapy (ART), adherence to treatment, retention in care, and virologic suppression (Gardner et al., 2011). Poor retention in care is associated with lower rates of ART use (Giordano et al., 2003), delayed viral suppression (Crawford et al., 2014), and increased risk of mortality. This measure will help providers direct their attention and quality improvement efforts towards improving retention in care.

Denominator definition: Patients with at least one encounters during the active 2yr lookback period regardless of age, with a diagnosis of HIV during the first 240 days of the measurement period or before the measurement period who had at least one eligible encounter during the first 240 days of the measurement period

Numerator definition: Patients who had at least one eligible encounter and one HIV viral load test at least 90 days apart during the measurement period, or who had at least two eligible encounters at least 90 days apart during the measurement period

Exclusions definition: N/A
