Health Dimension: HIV Viral Suppression

PHX Label: HIV Viral Suppression
PHX FeatureId: ID_05
PHX Feature Type: Health Dimension
PHX Description: hiv patients with viral suppression
PHX Full Description: Percent of hiv patients with hiv viral load less than 200 copies/ml
Version: v1.0
Created: 10/19/2026

Source: CMS eCQM
Source Title: HIV Viral Suppression
Source Reference Id: CMS314
Source Specification Link (if applicable): HIV Viral Suppression

Overview/rationale: HIV viral suppression is a long-standing priority outcome among the HIV community in the United States and around the world. The National HIV/AIDS Strategy for the United States from 2022-2025, developed by the White House Office of National AIDS Policy with input from the HIV community across the United States, prioritizes increasing HIV viral suppression rates to 95 percent (The White House, 2020). The DHHS Panel on Antiretroviral Guidelines for Adults and Adolescents defines viral suppression as a viral load below the lower limits of detection in its guidelines on virologic failure, and it defines viral suppression as a viral load of less than 200 copies/mL as part of its guidelines for the use of antiretroviral therapy to prevent HIV transmission (Panel on Antiretroviral Guidelines for Adults and Adolescents, 2022).

Denominator definition: Patients with at least one encounter during the active 2yr lookback period regardless of age, who have a diagnosis with HIV prior to or during the first 90 days of the measurement period with at least one eligible encounter in the first 240 days of the measurement period.

Numerator definition: Patients with a last HIV viral load test result of less than 200 copies/mL during the measurement period.

Exclusions definition: N/A

PHX implementation notes: N/A
